water scorpion

stonefly nymph

water boatman nymph

water scorpion nymph

mayfly

mayfly nymph

hoverfly

A surprising number of flying insects have larva that live in the water. Some larva develop in the water in a matter of days or weeks, others spend a year or two as aquatic larvae (dragonfly, for example), then have a very short time as flying adults. The mayfly's adult stage is so short it doesn't even eat!

Use these cards to play a standard "memory" game where you flip over two cards at a time and see if you get a match. If they don't match, turn them back over. Make sure all players see the cards before turning them over.
